Cloud capable and communicating damper actuator for adjusting dampers in commercial HVAC applications.

- Non-Failsafe
- Air Damper Size Up to approx. 90 sq. ft.
- Nominal Torque 360 in-lb [40 NM]
- Power Supply AC/DC 24 V
- Ethernet 10/100 Mbit/s, TCP/IP, integrated web server
- Conversion of sensor signals
- Communication via BACnet/IP, Modbus TCP and Ethernet to Belimo Cloud

#### Functional data

- **Communicative control**
  - Cloud: (call for “clientAPI”)
  - BACnet/IP: (see “PICS” statement)
  - Modbus TCP: (see “Modbus Register”)
- **Position signal ‘S1’** 2-10 VDC (For local hybrid control use S1)
- **Universal sensor Input** two universal sensor inputs (S1 and S2)
  - Contact closure
  - Passive, 0...50KΩ (select type and value)
  - Analog (Active), 0-10 or 2-10 VDC (select)
- **Feedback output U** 2-10 VDC, 0.5 mA max., VDC variable
- **Direction of rotation** reversible with switch
- **Manual override** external push button
- **Angle of rotation** max. 95°, adjustable with mechanical stop electronically variable
- **Running time (Motor)** 150 sec (default), variable (70 to 220 sec)
- **Position indication** reflective visual indicator (snap-on)
- **Protection class IEC/EN** III safety extra-low voltage (selv)
- **Housing** NEMA 1
- **Housing material** UL94-V5A
- **Rated voltage supply / control** 0.8 kV
- **Ambient temperature range** -22°F to 122°F [-30°C to 50°C]
- **Storage temperature range** -40°F to 176°F [-40°C to 80°C]
- **Humidity** 5 to 95% RH non condensing (EN 60730-1)
- **Agency listings** cULus acc. to UL 60730-1A/-2-14,
  CAN/CSA E60730-1:02,
  CE acc. to 2004/108/EEC and 2006/95/EC

#### Safety

- **Servicing** maintenance free
- **Quality standard** ISO 9001
- **Weight** 3.5 lbs [1.59 kg]

## Product Features

### Application
For proportional modulation of dampers in HVAC systems. Actuator sizing should be in accordance with the damper manufacturers specifications. The actuator is controlled via the Belimo Cloud, BACnet/IP or Modbus TCP and drives to the position defined by the control variable. Multiple data points can be written and read via the control interface. Local control mode: The actuator receives an analog control signal from a conventional controller and drives to the control position. In addition, using the Belimo Cloud, BACnet/IP or Modbus TCP, various data points can be read and with the exception of the control signal written to the actuator. This Belimo Cloud connected damper actuator has two universal sensor inputs ready for your innovative HVAC applications. The two universal sensor inputs (passive, active, or contact) serve as an analog/digital converter for the digital transmission of the sensor value to a higher level system. Selecting the sensor type is accomplished via connection to the integrated web server (RJ45 connection to the web browser) or directly via the Belimo Cloud. The actuators performance and sensor data is recorded locally with 13 months of storage. This data can be used for analytical purposes, downloaded via csv files, or used in your HVAC application.

### Operation
The GMB actuators use a brushless DC motor, which is controlled by an Application Specific Integrated Circuit (ASIC). The ASIC monitors and controls the actuator’s rotation and provides a digital rotation sensing (DRS) function to prevent damage to the actuator in a stall condition. Power consumption is reduced in holding mode. The actuator is not provided with and does not require any limit switches, but is electronically protected against overload. The GMB series provides 95° of rotation and a visual indicator indicates position of the actuator. When reaching the damper or actuator end position, the actuator automatically stops. The gears can be manually disengaged with a button on the actuator cover. The anti-rotation strap supplied with the actuator will prevent lateral movement. Add-on auxiliary switches or feedback potentiometers are easily fastened directly onto the actuator body for signaling and switching functions.

### Direct mounting
Simple direct mounting on the damper spindle with an universal spindle clamp, supplied with an anti-rotation device to prevent the actuator from rotating.

### Converter for sensors
Connection option for two sensors (passive, active, or contact). The actuator serves as an analogue/digital converter for the transmission of the sensor signal to the higher level system.

### Communication
The parameterization can be carried out through the integrated web server (RJ45 connection to the web browser), by communicative means or via the Cloud. Additional information regarding the integrated web server can be found in the separate documentation.

### Position signal inversion
Signal inversion in cases of control with an analogue positioning signal. The inversion causes the reversal of the standard behavior, i.e. for control signal 0%, the actuator is opened to Max and for control signal 100%, the actuator would close.

### Data recording
The recorded data (integrated data recording for 13 months) can be used for analytical purposes. Download the csv files via the built-in web browser.

### Manual override
Manual override by push-button keeps the gear is disengaged for as long as the button is pressed or remains locked (by the little tab inside the override button).

### Adjustable angle of rotation
Adjustable angle of rotation with mechanical end stops.

### High functional reliability
The actuator is overload protected, requires no limit switches and automatically stops when the end stop is reached.

### Home position
The first time the supply voltage is switched on, i.e. at the time of commissioning, the actuator carries out an adaption, which is when the operating range and position feedback adjust themselves to the mechanical setting range. The actuator then moves into the position defined by the direction of rotation switch and desired positioning signal.
Electrical installation

Notes
- Connection via class 2 transformer.
- Parallel connection of additional actuators is possible (power and control).
- Limit of ONE actuator per control shaft!

Additional notes
1. Provide overload protection and disconnect as required.
2. CAUTION Equipment Damage! Actuators may be connected in parallel if not mechanically mounted to the same shaft. Power consumption and input impedance must be observed.
3. Actuators may also be powered by 24 VDC.
4. Additional actuators may be wired in parallel. Ensure sufficient power supply VA is available.
5. For “Local Control” via 2-10VDC the S1 sensor must be used and configured as 'Active Sensor'.
6. Connection to Intranet / Internet via RJ45 socket
7. Connection of a notebook for initial parameterization and/or manual control via RJ45 connection. Optional direct connection via RJ45 for direct access to integrated webservice and stored data.

Wiring diagrams

Initial Ethernet Connection and Set-up

“Peer to Peer” connection:
http://belimo.local:8080, the Notebook must be set to “DHCP”. Make sure that only one network connection is active.

Standard IP address:
http://192.168.0.10:8080, static IP address

Password (read-only):
User name: «guest»
Password: «guest»
**Electrical installation**

**Notes**

- Connection via class 2 transformer.
- Parallel connection of additional actuators is possible (power and control).
- Limit of ONE actuator per control shaft!
- The wiring diagrams show connections for the first sensor on terminal S1, while the second sensor can be identically on terminal S2.
- Different sensor types can be used with each sensor input. For example, active 2-10 on S1 and NTC1000 on S2.
- For “hybrid” operation, analog input and digital communication, S1 is used as the analog input and must be configured as ‘active sensor’.

**Additional notes**

1. Provide overload protection and disconnect as required.
2. CAUTION Equipment Damage! Actuators may be connected in parallel if not mechanically mounted to the same shaft. Power consumption and input impedance must be observed.
3. Actuators may also be powered by 24 VDC.
4. Additional actuators may be wired in parallel. Ensure sufficient power supply VA is available.
5. For “Local Control” via 2-10VDC the S1 sensor must be used and configured as ‘Active Sensor’.
6. Connection to Intranet / Internet via RJ45 socket
7. Connection of a notebook for initial parameterization and/or manual control via RJ45 connection. Optional direct connection via RJ45 for direct access to integrated webserver and stored data.
8. Addition of sensors is optional.
9. Configure the actuator sensor input according to the sensor type and value. The connections for the first sensor on terminal S1, while the second sensor can be connected identically on terminal S2. Simultaneous use of different sensor types is possible. For example: a contact closure on S1 and a VDC sensor on S2.

Local analog control or analog override with Belimo Cloud (TCP/IP), BACnet IP, or Modbus TCP connection.

Connection of contact closure sensor

Connection of passive sensor

Connection of active sensor
Feature overview

1. Direction of rotation switch
   Switch: Changes the direction of rotation

2. Power and control cable with green LED
   Off: No power supply or wiring error
   On: Actuator starts operation
   Flickering: In operation

3. Push button LED display, orange
   Off: Standard mode
   On: Adaption or synchronization active
   Press button: Triggers an angle of rotation adaption, then standard mode.

4. Manual override
   Press button: Gear disengages, motor stops, damper is overridden.
   Release button: Gear engages, synchronization starts, standard control.

5. Service plug
   For connection of ZTH

6. RJ45 socket
   For connection of TCP/IP (Cloud), BACnet/IP, and Modbus TCP
