WARNING!

Before replacing actuator, damper must be inspected and determined to be fully functional. See NFPA 80 & NFPA 105 below for detailed checklist.

WARNING!

Installer must be trained and experienced with repair of fire and smoke dampers and actuators.

www.belimo.us/firesmoke
In the “Marking & Application Guide, Dampers for Fire Barrier and Smoke Applications & Ceiling Dampers” April 2013 by Underwriters Laboratories Inc.®, page 6 they state:

**DAMPER ACTUATORS**

“… field mounting or substitution of actuators is not covered within the scope of the UL certification of the product. However, this does not necessarily preclude replacement of actuators in the field. Like any appliance, field servicing of these products is not covered under the scope of the UL certification and factory follow-up service program. As with any part of the damper, it is expected that replacement of actuators in the field be done in accordance with the damper manufacturer’s normal field servicing program.”

**Code and Standard Issues**

In general, the administrative section of codes state that all mechanical and electrical systems must be kept in working order and an individual section may state that all life safety devices and systems must be operable. NFPA 80 (Fire) & NFPA 105 (Smoke) require periodic testing and repair of dampers as soon as possible after any deficiency is uncovered.

**Chapter 7 IBC & IFC “Containment” Dampers**

| Commissioning | End of first year | Every 4 years except in hospitals every 6 years |

**Chapter 9 IBC & IFC**

**Fire detection & Smoke control systems**

| **Dedicated** | Weekly self-test |
| **Non-dedicated** | Not required |

Fire & smoke dampers are appliances and field replacement of components is required when failure of any component occurs.

The Authority Having Jurisdiction (local Fire Marshal and/or Building Official) must be consulted if any blade or auxiliary switches are employed and are connected to the fire alarm system or to a Fire Fighters Smoke Control System (FSCS) panel. Retesting is required. A permit and inspection may be required since connections to an alarm system have been touched.
NFPA 80 (Fire) & NFPA 105 (Smoke)

NFPA requires damper inspection and repair of dampers. See www.nfpa.org for Standards.

See NFPA 80 & NFPA 105 for details. The damper cleaning and examination check list here is based on them.

Damper installation shall meet code requirements. Fire stopping and drywall integrity shall be confirmed. Damper blades shall be in plane of wall. Duct shall be fall away with no fasteners connected to damper sleeve.

a. Dampers and ducts shall be cleaned of all foreign debris and dust build-up.
b. All exposed moving parts of the damper shall be dry lubricated as required by the manufacturer. Do not use oil as it draws dirt.
c. Damper shall be examined without defective old motor or new actuator to determine:
   i. The damper shall fully close from the open position.
   ii. Damper shall fully open from the closed position.
   iii. There are no obstructions to the operation of the damper. The damper shall not be blocked from closure in any way due to rusted, bent, misaligned, or damaged frame or blades. The damper shall not have defective hinges, side &/or blade seals, or other moving parts. The damper frame shall not be penetrated by any foreign objects that would affect operation.
d. If the damper is equipped with a fusible link, the link shall be removed for testing to ensure full closure and lock-in-place if so equipped. If the link is damaged or painted, it shall be replaced with a link of the same size, temperature, and load rating.
e. The fusible link shall be reinstalled after testing is complete.

After installation and wiring of new actuator it shall be tested.
a. The checklist may be customized using material here and in NFPA Standards. Multiple geometric configurations of springs, fusible link, thermal sensor(s), and actuation are possible. Confirm with AHJ if any additional requirements exist.
b. Electric thermal sensors, if present, must be tested and replaced if defective.
c. The test shall be conducted with normal HVAC airflow.
d. When equipped with smoke detection activation, the smoke detector shall be activated and damper operation observed.

Test voltage input to actuators and repair as necessary if voltage is not correct. Old breakers often deliver below 115V and failed motors may be due to power supply problems or the motors may have damaged breakers.

A record of all repairs must be kept and made available to AHJ.
Local Code Approval

While it is not detailed in codes, the following rules should be followed for selecting Belimo actuators for replacement:

Check the technical specifications to ensure an “equal or better” actuator is used.

- **Temperature** – the replacement actuator shall have been UL555S tested at the same or better temperature as the original actuator. 250˚F or 350˚F are standard.
- **Time** – the replacement actuator shall drive open and spring closed at a speed equal or faster than presently required by codes. (The AHJ may grant an exception and “grandfather” slower actuators where the original actuator was slower.)
- **Torque** – replacement actuator shall have equal or greater torque than the failed actuator.
- **Voltage** – replacement actuator shall have the same voltage rating as the original.
- **Amperage** – the replacement actuator(s) shall not draw more amperage than the original(s) and cause the total connected amp draw on a circuit breaker to be greater than allowed by electrical code.
- **Final Testing** – actuated damper and associated devices shall be tested for proper operation. See Acceptance testing details below in Fire Marshal Notification Form.

(Mnemonic device: TTT-VAT)

---

**WARNING!**

In all cases, installation must comply with any and all local electrical and life safety codes. Operation of the system after installation must be performed to verify proper damper cycling. Final checkout requires verifying correct function.

**WARNING!**

Note that where any fire alarm wiring is touched, the fire department or fire alarm company must be informed.

</table>
The FSTF series actuators were introduced in 2013. They are 18 in-lb and designed for under 1.5 sq.ft. of fire and smoke damper. Use on larger dampers only when replacing an existing FSTF on a fire and smoke damper.

The FSLF is recommended for small dampers.

| Belimo actuators pass UL555S at the same damper sizes as the Honeywell. | NOTE. Although an actuator may operate a larger sized damper use the UL listed sizing. Call for assistance. |

**Typical Installations**

**Multisection Damper Assembly**

When measuring damper size, add the area of multiple sections together if controlled by a single actuator.

**Fusible Link**

The photographs above show a shaft spring held by a fusible link. If the link melts due to 165°F ambient temperature, then the spring closes the damper. The actuator is bypassed. Some Nailor dampers use this fire function closing method. Others use an electrical thermal sensor.
Nailor damper with MA220 motor

Motor is non-spring and the spring is inside the damper on the shaft.

Three views of an MA220 on a Nailor damper.
The left shaft spring and fusible link are NOT to be removed or modified. Note they could be on right side in some dampers.

Yellow arrows point to the same spring. If the fusible link melts due to temperatures over 165°F the shaft spring slams the damper closed. This is the fire function.

Right spring closes damper for actuator function only. This is typically a smoke detector function. The right spring must be disconnected.
Basic Replacement and Installation of Belimo

1. Remove old motor
2. Retain mounting plate.
3. There are three ways to mount the actuator.
   a. Use a 4” x4” or other steel plate to hold the anti-rotation strap
   b. Remove the existing mounting plate and bend anti-rotation strap before screwing it to the sheet metal sleeve.
   c. Use a Belimo linkage ZG-AF or equal. (Rarely necessary.)
4. Attach Belimo anti-rotation strap to the existing mounting plate.
5. Close damper tight
6. Mount Belimo FSLF (220) or FSNF (230) to damper shaft, tighten anti-rotation strap and clamp.
7. Wire per drawings in next section.
8. Test and complete report form on last page.

Mounting

FSLF mounted on the damper shaft. Two sheet metal screws hold the anti-rotation strap. Two nuts secure cold-weld clamp onto shaft.

FSNF mounted on the damper shaft. Two screws hold the anti-rotation strap. Two nuts secure cold-weld clamp onto shaft.

FSAF mounts the same.

Note that actuator floats freely. Clamp cold-welds when teeth dig into the damper shaft and the anti-rotation strap stud allows the actuator to move if shaft is not perfectly concentric. Rigid mounting by jamming the stud into the U-slot of actuator is NOT usually best.
**Direct Coupling**

Distance at top must be the same as at bottom

Actuator must be perpendicular to the damper shaft.

Actuator should be parallel to the plane of the damper frame and sleeve.

Allow any non-concentric shaft motion to be taken up by mounting stud in middle of U-slot.

**Figure 1**

Note how the pin of the anti-rotation strap is mounted in middle of actuator U-slot.

**Figure 2**

This is acceptable as long as mechanically solid.

**Figure 3**

As long as it is mechanically solid, the anti-rotation strap may be bent to fit height.
FSTF
Best solution for small dampers where the HW bracket has been hung out into the air is to use an FSTF actuator.

Short shaft mounting

For short shaft mounting, the ZG-LMSA-1/2-5 can be used. Alternately, the clamp can be installed between the actuator and sheet metal.

WARNING!
Anti-rotation strap may not be attached to the duct. It is attached to the damper sleeve or to a flat plate secured to the damper or sleeve.

The duct must be free to fall away leaving the damper in the wall.

IMPORTANT:
Mount the actuator straight so that no stress twists the damper shaft inside the hollow cylinder or clamp.
**Anti-rotation strap**

11695 LF-P

The heavier duty 11414 AF-P may be ordered when needed.

Bend strap at perforations to adjust for necessary height.

**Linkage mounting**

**WARNING!**

Read Data Sheet provided in box with each actuator for specific wiring details.

Possible alternate arrangements for damper clip. (FSNF, FSAF actuators shown.)
Miscellaneous parts

Should they be needed, Belimo carries a range of parts. Ball joints and 5/16" rods are available from most distributors.

Where the crank arm on the jackshaft is broken or not of the type needed, the KH12 fits over the shaft without removing it. Zinc plated steel. Slot is for the KG10A ball joint. V-bolt fits ¾" to 1" (20 to 25mm) shafts.

KH-6. Zinc plated steel. For shafts 3/8" to 11/16" Uses KG6 ball joint. Slot width 1/4"

KH-8. Zinc plated steel. For shafts 3/8" to 11/16" Uses KG8 (90 degree) or KG10A ball joint. Slot width 21/64"

SH8 (not shown – see picture page 9). Push-rod for KG6 & KG8 ball joints. 5/16" 36" long
Use SH10 3/8” rods for GMB and dual FSAF or FSNF linkages. 5/16” can bend under heavy loads.

**ZG-DC1** Damper blade clip and ball joints for blades typically 3.5” in width. Typically the actuator or rod to shaft is in front of blade.

**ZG-DC2** Damper blade clip and ball joints – typically used for 6” wide blade control dampers. Typically the actuator or rod to shaft is above or below the damper.

**Thermal sensor replacements – BAE165 US**

Original equipment is recommended although not strictly required by code. UL does not regulate replacement or repair. See NFPA 80 or NFPA 105.

**Belimo BAE165 US**

Where existing sensor is defective or one must be added, the 165°F primary sensor may be used.
**Auxiliary Switches**

**Damper blade switch assembly**

Where the original switches for signaling position to a Fire Fighters’ Smoke Control Panel or to local indicator lights must be replaced or are inoperative, the Belimo –S model actuators may be used or a S2A-F may be installed.

**Belimo S2A-F**

FSLF (mid 2014ff), FSNF, and FSAF actuators can use the add on switch package.

-S models

Some models are SPDT. Check data sheets.

Internal switches

S1 Contact closed if damper closed
S2 Contact closes if damper open

Switch cable

Closed Hot Open
Wiring

There are three wiring schemes that describe all applications. While the geometry of the wire runs may vary, the connections are straightforward.

**WARNING!**

Read Data Sheet provided in box with each actuator for specific wiring details.

**WARNING!**

Disconnect and lock out power before starting to disconnect old motor.

There are three wiring schemes that describe all applications. While the geometry of the wire runs may vary, the connections are straightforward.

**Fusible link DAMPER ACTUATOR WIRING**

**SMOKE DAMPER ACTUATOR WIRING**

The drawing above shows the wiring when there is a fusible link and separate spring on the damper shaft. The same wiring is used when the damper is smoke only since then there is no temperature sensor.
**TYPICAL FIRE - SMOKE COMBINATION DAMPER Wiring**

**Electric thermal disc**

Smoke Detector or Relay from area smoke detection system

- HOT 120 or 24 VAC
- To alarm system

**TYPICAL SENSOR TEMPERATURES**

- 165°F
- N or COM

BELIMO FSxx ACTUATOR

The drawing above shows the wiring when the primary sensor is an electrical thermal disk. Note that the alarm connections are not touched when replacing an actuator. This is a major concern for Fire Marshals.

**Honeywell with actuator wiring compartment used for junctions.**

Note that where any fire alarm wiring is touched, the fire department must be informed. A permit and inspection may be required.

**WARNING!**

Various field modifications may have occurred over time. If any question about proper wiring exists, contact Belimo.
The wiring below is commonly connected to alarm or smoke control electronic modules in modern systems. The functional sequence is the same.

**TYPICAL REOPENABLE DAMPER with FSCS**

**Belimo Auxiliary Switches for position indication to FSCS**

The auxiliary switches are used to provide status indication to the fire fighters’ smoke control panel. Typically there are two or three status lights or leds. This wiring is the responsibility of the fire alarm company. If it is touched, they must retest to verify proper operation.

**WARNING!**

- Damper must be free to move from open to closed without undue stress.
- Damper and duct must be clean and free of all debris.
- Test damper and controls per Fire Marshal’s checklist below.
- Fire alarm company may need to be present to verify proper status indication at FSCS panel.
Building Official / Fire Marshal Notification Form

Retain this portion of checklist at premises for inspection. See local AHJ or Fire Marshal for other information and requirements regarding conformance with NFPA 80 & NFPA 105.

☐ Test Checklist (Smoke dampers do not have sensors. Only steps a & b apply.)

1. Single Sensor Combination Damper
   a. □ Open smoke detector or relay wire or contact to cut power. Damper springs closed.
   b. □ Reconnect power. Damper drives open.
   c. □ Open thermal sensor using heat gun or disconnect fusible link. Damper springs closed.
   d2. □ Open damper and reinstall fusible link or replacement.

2. Reopenable Two Sensor Fire-Smoke Combination Damper
   (Since this system involves the Firefighters’ Smoke Control System, inform fire department.)

With FSCS switch in Auto position:
   a. □ Disconnect power from smoke detector or relay contacts. Actuator springs damper closed.
   b. □ Reconnect power. Actuator drives damper open.
   c. □ Trip thermal sensor. Actuator springs damper fully closed.

Test FSCS switch functions
   a. □ Move FSCS switch to Off position. Actuator springs damper fully closed.
   c. □ Trip secondary (higher temperature) thermal sensor. Actuator springs damper closed.

Move FSCS switch back to Auto position:
   □ Actuator springs damper closed if Primary sensor is still open.
   □ Actuator stays open if Primary sensor has re-closed.

Verification of status indication lights at FSCS panel is required with each step.

☐ When completed, ensure sensors are reset and smoke detector is in normal state and FSCS switch is in Auto. Damper is normally Open; check sequence of operation.
